PIM Master™ Introduction

Anritsu Company introduces the first battery-operated high power Passive Intermodulation (PIM) testing solution for the major wireless standards in use around the world. PIM is a form of interference generated by passive components that are normally thought of as linear such as connectors, cable assemblies, filters and antennas. However, when subject to high RF power levels found in cellular systems, these devices can generate spurious signals that increase the receiver noise floor and reduce site performance.

The PIM Master accurately measures PIM performance by injecting two CW test tones into the antenna feed network and recording the magnitude of the 3rd, 5th, or 7th order intermodulation products falling in the receive band of the system. The MW82119A is able to perform the following measurements enabling test technicians to quickly find and eliminate PIM problems found at the cell site:

- PIM versus Time
- Swept PIM
- Distance-to-PIM™ (DTP)
- Noise Floor versus Time

The PIM Master's small size and light weight combined with battery operation make it the ideal solution for verifying performance at difficult to access sites such as Remote Radio Head (RRH) installations or indoor Distributed Antenna Systems (DAS). Performing a PIM test at these sites often involves a tower climb or carrying the equipment up a ladder or through small access ports to reach the required point of test. The enhanced portability of the MW82119A enables high power PIM testing where required without heavy lifting and without long extension cords.

The PIM Master includes Anritsu’s patented Distance-to-PIM™ (DTP) technology for accurately determining the location of PIM faults both inside the feed system as well as beyond the antenna. This technology becomes critically important for fault finding DAS installations due to the complexity of the feed system and large number of RF interconnects. Without DTP, finding and eliminating PIM requires a process of elimination involving the movement of low PIM loads in the network until the PIM problem disappears. This process is not only time consuming, but it also means that good connections may be opened (and potentially damaged) in the process of locating PIM problems. Distance-to-PIM allows technicians to quickly and efficiently locate PIM sources at a site resulting in quicker site repairs and lower cost.

As with all Anritsu Handheld products, the MW82119A has been designed and tested to rigorous standards for shock, vibration and temperature extremes to ensure reliable service in an outdoor environment.

2 x 40 W Test Capability

Even though the package is small and it is battery operated, the MW82119A is a high performance PIM test solution allowing operators to adjust output power from 25 dBm (0.3 Watts) for indoor DAS testing to 46 dBm (40 Watts) for macro site testing. In both indoor and outdoor systems, PIM interference is highly dependent on the power level being transmitted by that system. By matching the PIM test power level more closely to the actual power level used at the site, operators will gain a clearer understanding of the true interference generated by both the RF infrastructure and the environment where the antenna is placed.
**PIM Master™ Overview**

**Distance-to-PIM (DTP)**

Distance-to-PIM (DTP) is similar to Distance-to-Fault (DTF), which Anritsu introduced in the Site Master™ in 1997 for identifying the location of impedance mismatches in a feed line. DTP quickly and accurately identifies the location of PIM faults inside the feed system as well as beyond the antenna. This capability eliminates the guesswork involved in isolating PIM sources and speeds site repairs.

Up to 6 markers can be activated in Distance-to-PIM to identify the magnitude and distance to PIM faults found in the system. Using Anritsu’s familiar Line Sweep Tools (LST) application, operators can overlay multiple DTP measurements to identify what has changed since the last visit. This enables the ability to see growing PIM problems and take corrective action before they impact network performance.

**PIM vs. Time**

The PIM Master includes a PIM versus Time measurement that tracks not only the instantaneous PIM level but also records the maximum PIM level experienced throughout a fixed frequency PIM test. The two test frequencies, transmit power level, intermodulation order (3rd, 5th or 7th) and test duration can be easily adjusted by the user to meet the test requirements.

This mode is useful for dynamic PIM tests as it not only captures the peak PIM value for pass / fail determination but also provides a visual indication of the stability of the system under test. When a limit line is entered in this mode, the color of the PIM magnitude changes to red when the value has exceeded the limit value. The peak value will remain red indicating a failure even if the PIM level returns to a passing level after the dynamic stress has been removed.

**Swept PIM**

When making a Swept PIM measurement, the PIM Master is able to evaluate changes in PIM magnitude versus Intermodulation (IM) frequency. This test is conducted by holding one transmit tone fixed while varying the frequency of the second transmit tone, causing the IM product to “sweep” across a range of frequencies in the receive band of the system. The magnitude of the PIM generated versus frequency is displayed and can be compared to a user-selected pass / fail limit.

PIM measurements are the vector sum of all PIM signals generated on a line at the IM frequency being tested. When multiple PIM sources exist, it is possible for the signals to combine out of phase at a particular test frequency indicating a passing result when the individual PIM levels are actually failures. A swept PIM test varies the IM frequency over a range of frequencies providing the user a clearer picture of the true PIM performance of the system. It is worth mentioning that Distance-to-PIM measurements provide the same function as they also evaluate a range of frequencies rather than a single IM frequency.

**Remote Control**

The PIM Master can be configured for remote control via WiFi to support a variety of testing scenarios. Line of site distances of >100m (>328FT) have been achieved allowing a person on the ground to control of the test equipment while a person at the top of the mast makes connections and performs dynamic testing. This capability is also useful for rooftop testing, allowing one person to control the test remotely while following the cable run and performing dynamic tests.

**Noise Floor Measurement**

A special test mode is available that activates the PIM Master receiver to monitor the IM product frequency vs. time. During this measurement, the PIM Master transmitters are disabled. This feature allows the user to quickly check to make sure the spectrum is clear before performing a PIM test.

**Easy to view display**

The PIM Master uses the same large, field proven, color touch screen displays found in other Anritsu Handheld products. Five different screen settings are available to enhance visibility in the environment where the test will be performed. This includes a Black & White setting to improve readability in direct sunlight as well as a Night Vision setting to reduce screen brightness for nighttime operation.
PIM Master Passive Intermodulation Analyzer Features

Size: 350 mm x 314 mm x 152 mm (13.8 in x 12.4 in x 6.0 in)
Lightweight: 9.0 kg to 12.2 kg (20 lb to 27 lb) depending on frequency option

External Power Output
LAN
Dual USB Type A
USB Mini-B
Factory use only
GPS

Connector Panel for MW82119A

Line Sweep Tools for Cable, Antenna, and PIM Analyses

Line Sweep Tools (LST) is a post processing tool to manage and archive measured data from Anritsu’s cable & antenna analyzers as well as PIM analyzers. Measured PIM results from different frequency band PIM Analyzers as well as measured data from your SiteMaster™ can be combined together into a single, unified site report.

In one report an operator can have all of the information needed to verify the integrity of an antenna system with the measurements of:

- PIM
- Distance-to-PIM (DTP)
- Return Loss
- Insertion Loss
- Distance-to-Fault (DTF)

Contractors, technicians, and engineers can be more productive with one cohesive tool to learn and use in managing antenna line quality measurements.

PIM Master™ Certified PIM Measurement Training Course

Specialized PIM Master™ passive intermodulation measurement training is an intense one-day instructor led training course that focuses on making PIM measurements (theory and lab). This is modeled on our successful Site Master™ Certified Line Sweep course.

• Brief Course Outline
  • Definition and Description
  • How PIM differs from Return Loss
  • Why is PIM a problem
  • How to test for PIM
  • PIM testing process
  • Hints for successful testing
  • Assessing results

• Labs
  • Hooking up the equipment and confirming proper operation
  • Measuring known good and bad devices
  • Device measurement practice

• Exams
  • Theory and safety
  • Hands-on practical

• Certification (after passing exams)
  • Certificate of Completion
  • Wallet-sized photo ID

Students will learn technical aspects of PIM measurements, how to set up a PIM measurement, useful examples of what works and what doesn’t, interpreting results, and locating the PIM.

Customer Support

Like all Anritsu products, the PIM Master has a range of support products, services and training allowing you to maximize your return-on-investment.

With Anritsu’s design know-how and demanding production testing and performance verification you can count on the PIM Master to give you years of reliable, dependable service.
PIM Master™ Specifications

General Specifications

All specifications and characteristics apply under the following conditions, unless otherwise stated: 1) After 5 minutes of warm-up time, where the instrument is left in the ON state; 2) All specifications subject to change without notice; 3) Typical performance is the measured performance of an average unit; 4) Recommended calibration cycle is 12 months.

Instrument Setup Parameters

| Frequency | Carrier F1, Carrier F2, Intermodulation Order (3rd, 5th, 7th) |
| Amplitude | Ref Value, Scale, Auto Range (On/Off), Amplitude Tone (On/Off) |
| Setup | Output Power, Test Duration (1 s to 3,600 s) |
| Limit Lines | Limit (Upper/Lower), On/Off, Limit Move, Limit Alarm (On/Off, PASS/FAIL indicator) |
| GPS | On/Off, 3.3/5.0 V |
| DTP | Cable Velocity, Distance |

PIM Measurement Ranges

- **RF Test Power**: Two CW tones 25 dBm to 46 dBm, 0.1 dBm steps
- **Residual PIM Performance**: <-117 dBm, <-125 dBm typical (2x 43 dBm test tones)
- **PIM Measurement Range**: -70 dBm to -130 dBm

</table>

PIM Master Connectors

- **Test Port**: 7/16 DIN, female, 50 Ω
- **Dual USB Type A**: 2x Type A (connect USB Flash Drive and USB Power Sensor)
- **USB Mini-B**: 1x Mini-B (connect to PC for data transfer)
- **GPS**: SMA, female (with GPS option only)
- **External Power**: 2.1 mm x 5.5 mm barrel connector, 12 to 15 VDC, < 5.0 A

Display

- **Size**: 213 mm (8.4 in) touch screen
- **Resolution**: 800 x 600

Battery

- **Type**: Li-Ion
- **Battery Operation**: 2.5 hours, typical

Power

- **Emergency Stop**: Red push button
- **AC/DC Adapter Input**: 100-240 VAC, 50/60 Hz, Output: 12 VDC

Electromagnetic Compatibility

- **Australia and New Zealand**: C-tick N274
- **Interference**: EN 61326-1:2006
- **Emissions**: EN 55011:2007
- **Immunity**: EN 61000-4-2/-3/-4-4/-4-5/-4-6/-4-11
- **European Union**: CE Mark, EMC Directive 2004/108/EC

Safety

- **Safety Class**: 2006/95/EC, EN 61010-1 Class 1
- **Product Safety**: IEC 60950-1 when used with Anritsu Company supplied Power cable

Environmental

- **Operating Temperature**: -10 °C to 55 °C
- **Relative Humidity**: 5 % to 95 % at +40 °C, Non-condensing
- **Shock**: MIL-PRF-28800F Class 2
- **Storage**: -51 °C to 71 °C
- **Altitude**: 4600 meters, operating and non-operating

Size and Weight

- **Size**: 350 mm x 314 mm x 152 mm (13.8 in x 12.4 in x 6.0 in)
- **Weight**: 9.0 kg to 12.2 kg (20 lb to 27 lb)
